Abstract

Investigating the effectiveness of media literacy interventions is essential to identify the most promising programs. This 2022 systematic evidence review, guided by the Preferred Reporting Items for Systematic Reviews and Meta-Analyses guideline, aimed to collect and synthesize scientific evidence on effective media literacy intervention programs across different target groups and the used frameworks. A comprehensive search across major scientific databases (Web of Science, Scopus, ProQuest, Communication & Mass Media Complete, and Education Resources Information Centre) and rigorous screening and coding processes identified 119 studies on media literacy intervention effectiveness and outcomes. This review offers valuable insights into the current state of media literacy intervention research, emphasizing the importance of considering diverse target groups and exploring a wide range of outcomes to enhance our understanding of these interventions' impact.

---

1. Introduction

In today's digital era, characterized by an abundance of information and rapid technological advancements, the ability to critically navigate and adequately use media and digital content is crucial. While scholars propose varying definitions of media literacy, there is consensus that it involves specific knowledge and skills facilitating critical comprehension and use of media (Hobbs, 1998; Jeong et al., 2012; Marten, 2010; McCannon, 2009). Media literacy, broadly defined as the ability to access, analyze, evaluate, and create media content, inherently includes digital skills. Digital skills—such as competencies in using digital devices, platforms, and tools—are a key subset of media literacy. Together, they equip individuals to navigate the digital media landscape effectively, enabling informed decision-making and protection against misinformation and digital threats (Helsper et al., 2020).

A media literacy intervention is an educational approach designed to enhance critical thinking by improving knowledge of media, raising awareness of media influence, and honing the ability to assess media representations (Byrne, 2009). These interventions aim to develop individuals' skills to understand media messages, recognize biases, discern credible sources, and understand media effects on individuals and society. Similarly, digital skills interventions focus on empowering individuals with the ability to effectively and safely use digital technologies (Alon et al., 2024). Media literacy, as a broad concept that includes digital skills, combines the ability to critically understand media content and use digital tools effectively. To enhance these skills, various interventions have been implemented in educational, community, and organizational settings, helping diverse populations develop these important competencies.

Theories are a key element of these interventions, as they allow for the precise implementation of pedagogical, andragogical, and geragogical experiments (Passey, 2020). Such theories facilitate the design and implementation of interventions that shape media literacy. Although theories are a valuable and informative foundation for researchers to build and design media literacy interventions, research attests that interventions do not always contain explicit theoretical frameworks that allow for the definition of variables or the interpretation of research findings (Jeong et al., 2012).

Existing systematic reviews and meta-analyses have explored various outcomes of media literacy interventions, focusing on both cognitive and behavioral dimensions. Early work, such as Bergsma and Carney's (2008) systematic review of health-promoting media literacy, assessed the effectiveness of interventions aimed at improving knowledge and attitudes towards health-related content. More recently, Polanco-Levicán and Salvo-Garrido (2022) expanded the scope of media literacy to include social media literacy, emphasizing competencies related to the evaluation and critical consumption of social media content. Both studies contribute to understanding media literacy in specific domains but leave gaps in terms of evaluating the broader impacts of media literacy interventions across diverse contexts and populations. Vahedi et al. (2018) and Xie et al. (2019) provide more recent meta-analyses, extending beyond the work of Jeong et al. (2012). Vahedi et al. (2018) focused on adolescents' risky health behaviors, concluding that

media literacy interventions can change attitudes and intentions regarding health risks. Xie et al. (2019) examined media literacy interventions in the context of deviant behaviors, further highlighting the role of tailored media literacy programs in behavior modification. Both studies underscore the need for interventions that specifically target behavior-related outcomes, yet they do not fully address how these programs work across different demographic groups or in diverse settings.

Previous research has categorized media literacy outcomes into several dimensions, such as knowledge of persuasion, advertising (Buijzen, 2007; Hobbs & Frost, 2003), critical thinking (Austin & Johnson, 1997; Austin, Pinkleton, Hust, & Cohen, 2005), and media influence recognition (Scull, Kupersmidt, & Weatherholt, 2017; Scull, Malik, et al. 2019). Behavioral outcomes, such as changes in attitudes, self-efficacy, and social norms, are also critical (Fishbein & Yzer, 2003). However, as noted by Jeong et al. (2012), media literacy interventions tend to have a stronger effect on media-related outcomes than on behaviors. This finding is supported by studies on practical competencies in digital skills (Haddon et al., 2020; Livingstone et al., 2021), which emphasize the need for integrating safe digital practices into media literacy programs. Despite the valuable contributions of these reviews, there remains a gap in understanding the effectiveness of media literacy interventions across diverse populations. Much of the research, as Edwards et al. (2021) note, focuses on adult participants, with limited attention to minors, youth, or other vulnerable groups. Furthermore, findings rarely account for demographic factors like ethnicity, disability, or socioeconomic status, which are crucial for addressing digital inequalities. Research by Ayala and Elder (2011) shows that interventions not tailored to specific target groups often fail to meet their objectives, emphasizing the importance of designing programs that account for the experiences and needs of diverse populations.

The present review addresses these gaps by systematically evaluating media literacy interventions across multiple contexts, with a particular focus on the inclusion of diverse and vulnerable groups. By assessing empirical studies published between 2012 and 2022, this review builds a robust evidence base on the outcomes of media literacy interventions and identifies the characteristics of successful programs. This research aims to inform the design, implementation, and evaluation of future interventions, offering insights into the broader societal implications of media literacy, including its role in addressing digital inequalities, misinformation, and digital citizenship. Accordingly, the present systematic evidence review was conducted with the following objectives: (a) To build a robust evidence base on the outcomes of media literacy interventions, and (b) to identify the characteristics of potentially effective media literacy intervention programs that lead to positive outcomes across diverse contexts. The specific research questions are:

RQ1: What characteristics of media literacy intervention programs contribute to achieving positive outcomes?

RQ2: How do variations in context influence the effectiveness of media literacy interventions?

2. Methodology

The review followed the Preferred Reporting Items for Systematic Reviews and Meta-Analyses (PRISMA) guidelines (Moher et al., 2009), which are widely used to ensure transparency and rigor in systematic reviews. PRISMA provides a structured approach for selecting, analyzing, and reporting studies, focusing on clarity in the presentation of the search strategy, inclusion criteria, data extraction, and synthesis of findings.

By adhering to these guidelines, this review ensures a comprehensive and systematic approach to analyzing media literacy interventions (See Supplementary File, Appendix 1).

2.1. Article Search and Study Eligibility Criteria

Article search included elaborating a search phrase, identifying and searching the relevant databases, and applying relevant filters to keep the search focused. The search stage started with the identification of key concepts related to the research questions. The search phrase, which incorporated a wide array of terms, was elaborated to ensure comprehensive coverage of the relevant media literacy studies. These concepts include keywords such as (a) "media literacy and digital skills," (b) "intervention," (c) "experimental," and (d) terms to exclude certain studies, specifically "medical." Each key term was paired with all possible synonyms, forming a detailed search phrase (see Supplementary File, Appendix 2, for more details).

Using the specified search terms, articles were obtained from various databases (including Web of Science, Scopus, ProQuest, Communication & Mass Media Complete, and Education Resources Information Centre). The search was further refined using specific eligibility criteria, including publication dates between 2012 and 2022, publications in English, and sources from peer-reviewed journals or conference proceedings. The search was conducted in December 2022.

2.2. Study Selection

2.2.1. Inclusion and Exclusion Criteria

Inclusion criteria were established to screen and select relevant studies for final analysis, ensuring alignment with the research questions at each stage. The inclusion/exclusion was applied in a cascading fashion, excluding studies at each stage if they failed to meet the initial criteria.

Initially, titles and abstracts were evaluated using the first set of selection criteria, excluding studies focused solely on media use or unrelated skills. Only studies about interventions aimed at teaching, developing, or stimulating media literacy and digital skills, and using quantitative methods such as experiments, quasi-experiments, or surveys, were included. Studies that did not meet these criteria were excluded. In the second stage, full texts were screened with an extended list of criteria, including quality appraisal based on Gough's (2007) weight of evidence framework. Studies needed clear definitions, measures, theoretical bases for media literacy and digital skills, and in-depth descriptions of interventions and their effectiveness. Only experimental or quasi-experimental methodologies comparing at least two conditions (treatment and control groups) were included. Studies also needed to address selection bias, include statistical significance testing, relevant control variables, and report main findings with effect sizes or statistical data.

The coding framework distinguished seven initial outcome categories: civic/participatory, economic/ employment, education/learning, media literacy and digital skills, physical well-being, psychological well-being, and socio-cultural well-being. This approach, shaped by a wide body of research to capture positive outcomes across various life domains, ensured that the coding framework reflected the broader range of potential impacts of media literacy interventions. The "other" option was included for outcomes not fitting these categories. Following analysis of the "other" category, two additional outcome categories were

added: Cognitive outcomes and Technology acceptance. The emergence of these categories highlights the review's responsiveness to findings that were not initially anticipated, ensuring a comprehensive analysis rather than merely adhering to initial preconceptions. Civic/participatory outcomes include digital citizenship performance and perceptions of partisanship. Education and learning outcomes involve variables such as literacy and perceived learning. Media literacy and digital skills outcomes cover digital literacy, programming skills, and attitudes about online risks. Physical well-being outcomes include subjective health and attitudes towards e.g., smoking. Psychological well-being outcomes consist of body image, confidence, and social comparison. Socio-cultural well-being outcomes involve bystander intentions and gender role norms. Cognitive outcomes encompass mental effort (e.g., processing information), flow, and self-efficacy. Technology acceptance outcomes include perceived usefulness, perceived ease of use, and user satisfaction.

2.2.2. Selection Stages

The initial search across databases yielded 5,890 results. After removing duplicates and retractions, 4,878 unique results were screened. After applying the selection criteria, 119 studies were included in the final pool of studies to be reviewed (see Supplementary File, Appendix 3, for a summary of the selected studies). The whole process of screening and data on study inclusion/exclusions is captured in the Supplementary File, Appendix 1.

2.3. Reliability of Screening: Intercoder Reliability

Six teams, each consisting of two to three coders, assessed intercoder reliability for inclusion/exclusion decisions at both the title and abstract level and the full-text level. Abstracts and articles were randomly selected from the pool of eligible articles, and Fleiss' kappa (κ) was calculated using JASP (version 0.17.1; JASP, 2024). Three rounds of screening were conducted to achieve substantial agreement between coders, reaching a Fleiss' κ of 0.63, based on Landis and Koch's criteria (Landis & Koch, 1977). Notes were kept on inclusion or exclusion reasons, and after each round, team discussions resolved uncertain cases.

In the final round, 451 articles (approximately 9.2% of the total 4,878 abstracts) were screened. After the third round, all remaining abstracts were screened for full-text eligibility. To assess intercoder reliability at the full-text level, 72 articles (approximately 10.6% of the total 678 articles) were screened. The initial round yielded a substantial agreement with a Fleiss' κ of 0.79. Following thorough team discussions to resolve any differences, full-text screening was conducted on all remaining studies, resulting in 119 studies being selected for final coding and analysis.

2.4. Data Collection: Coding Frame for Data Extraction

The final 119 studies were coded and analyzed using a framework developed from literature consultations and observations during the full-text screening. This framework comprised five main sections: article information, intervention characterization, methodology, intervention outcomes, and potential drivers or enablers of the intervention effects. The article information section captured details such as authors, study title, publication name, and study/publication quality. The intervention characterization section gathered data on targeted skills, target groups, intervention procedures, and other relevant elements.

The methodology section provided information on reviewed study design, data collection methods, and sample size. The largest section, focusing on intervention outcomes, recorded the measured outcomes, including the type of effect (within-group, between-groups, or interaction) and the statistical information needed to evaluate effect size. The final section concentrated on potential drivers or enablers of intervention effects, such as mediators and moderators. Coding was performed using Qualtrics software (Qualtrics, 2022), where a questionnaire capturing the required information was filled out for each study. The completed dataset was then exported to SPSS and Excel for further analysis.

2.5. Data Analysis

In addition to descriptive analysis, the data exploration primarily involved calculating the effect sizes of the identified interventions and factors on media literacy of various target groups, using the statistical data collected from the studies. Effect sizes for each outcome were gathered from the articles. When effect sizes were not reported, but other statistical information such as means, standard deviations, and sample sizes were available, effect sizes were calculated using an online calculator. The calculated effect sizes were reported as Cohen's *d* (Cohen, 1988), partial eta squared (Olejnik & Algina, 2003), or difference-in-difference. Effect sizes were interpreted using established thresholds (see Supplementary File, Appendix 4, for effect sizes thresholds).

Such analysis allowed for determining the significance of the interventions' effects and assessing the reliability of their impact across various outcomes, providing a robust basis for interpreting the effectiveness of each intervention.

3. Results

The results in this section are organized into three subsections: (a) the use of theoretical frameworks in media literacy interventions, (b) the effectiveness of interventions across various outcome categories, (c) and the effectiveness of interventions across different target groups.

3.1. Theoretical Frameworks

Although theories are a valuable and informative foundation for researchers to build and design media literacy interventions, 25.86% of the articles analyzed did not contain explicit references to theoretical frameworks that allow for the definition of variables or the interpretation of research findings. Forty-seven point twenty-two percent of the theoretical frameworks are linked directly to disciplines such as media studies, media psychology, media pedagogy, and media sociology. In contrast, 52.78% were "auxiliary" theories from other socio-humanities. The remaining 26.92% of the articles utilized general guiding principles i.e., instead of explicitly applying a specific theory, the articles have drawn on theoretical concepts without fully integrating or naming the framework.

The most frequently used theories were self-regulation within the context of social learning theories, the message interpretation process model, and various approaches to media literacy, each appearing in 9.72% of the articles. This was followed by the theory of planned behavior, cited in 8.33% of the studies. Additionally,

the Technological Pedagogical and Content Knowledge Framework appeared in 6.94% of the articles analyzed. A full overview of the theoretical frameworks is discussed by Vissenberg et al. (2023).

3.2. Effectiveness of Interventions Across Outcome Categories

We analyzed 119 studies examining the outcomes of media literacy interventions. On average, each study measured 3.5 different outcomes. Many outcomes were assessed using scales composed of several individual measurement items. When information on a composite variable was available, it was counted as a single measured outcome. In the absence of composite variable information, each individual measurement item was counted separately, explaining the high number of outcomes reported in some studies. Additional descriptive data and information on the effectiveness of the interventions are detailed in the following subsections.

Among the 119 studies, outcomes related to media literacy and digital skills were most frequently tested. These studies assessed 364 outcomes linked to media literacy and digital skills, accounting for 53.7% of the 678 effects studied. It is worth noting that the reported 678 effects pertain to the "effects studied" rather than the "papers/articles studied." A single article may investigate multiple effects of an intervention, which is why the total number of effects examined exceeds the 119 individual studies.

Out of the 678 effects of media literacy interventions across eight outcome types, 292 (43.1%) were non-significant, 180 (26.5%) were small effects, 79 (11.7%) were medium-sized effects, and 88 (13%) were large effects. For 39 effects (5.8%), no effect size was reported, and insufficient information was available for calculation. Figure 1 displays the number of outcomes and the effect sizes for each of the eight outcome categories.

Outcomes related to media literacy and digital skills were the most frequently tested, with 364 outcomes assessed, accounting for 53.7% of all 678 effects studied. For 27 outcomes (7.4%), no effect size was reported,

Figure 1. Effect size categories by outcome type.

and insufficient information prevented calculation. Of the tested outcomes, 152 (41.7%) were non-significant or adverse, 93 (25.5%) were small, 46 (12.6%) were medium, and 46 (12.6%) were large.

Psychological well-being outcomes were the second most frequently tested, with 127 outcomes examined (18.7% of all effects). For the majority (74 outcomes, 58.3%), no significant effects were found. Small effects were reported for 36 outcomes (28.3%), medium effects for 11 outcomes (8.7%), and large effects for six outcomes (4.7%).

Education and learning outcomes were the third most frequently tested, with 96 outcomes assessed. For 28 outcomes (29.2%), no effects were reported. Small effects were found for 21 outcomes (21.9%), medium effects for eight outcomes (8.3%), and large effects for 28 outcomes (29.2%). For 11 outcomes (11.5%), insufficient information was available to calculate the effect size.

Outcomes related to physical well-being (43 outcomes, 6.3%) and socio-cultural well-being (41 outcomes, 6%) were also tested. However, civic/participatory outcomes (three outcomes, 0.5%), cognitive outcomes (three outcomes, 0.5%), and technology acceptance outcomes (one outcome, 0.1%) were considered only sporadically.

3.3. Effectiveness of Interventions Across Target Groups

The following nine target groups were defined for further analysis of intervention effectiveness (expressed through effect size): children, youths, college students, (pre-service) teachers, young adults, adults, older adults, parents, and the general public. Figure 2 presents the effects of media literacy interventions on the eight outcome types for "children," defined as participants younger than 12 years old. Across the 119 studies, 94 effects were measured with child participants.

Figure 2. Effect size categories by outcome type for children.

Most effects were measured in the media literacy and digital skills category (44 effects, 46.8%) and the education and learning category (21 effects, 22.3%). Both categories showed a high number of large effects: 16 large effects on media literacy and digital skills (36.4% of all effects in this category) and eight large effects on education/learning outcomes (38.1%).

Fewer effects were measured for children in physical well-being (14 effects, 14.9%), psychological well-being (five effects, 5.3%), and socio-cultural well-being (eight effects, 8.5%). Only one effect was tested for civic/participatory outcomes (1.1%) and technology acceptance outcomes (1.1%). No effects on cognitive outcomes were tested in children.

Figure 3 displays the effects of media literacy interventions on the eight outcome types for "youths," defined as individuals aged 12 to 17, typically attending secondary education. Across the 119 studies, 290 effects were measured with youth participants. Two outcome categories were tested significantly more than others: media literacy and digital skills (141 effects, 48.6%) and psychological well-being (66 effects, 22.8%). While psychological well-being was sporadically tested in children, it is more frequently assessed in youths.

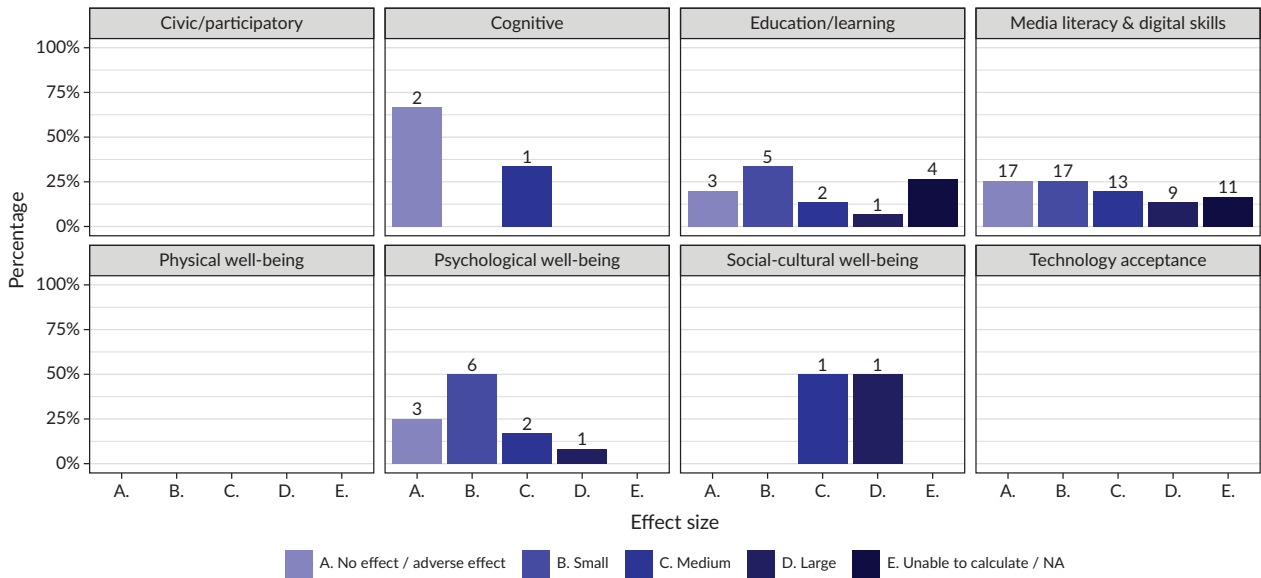

Figure 3. Effect size categories by outcome type for youths.

Other outcome categories included education/learning (33 effects, 11.4%), physical well-being (25 effects, 8.6%), and socio-cultural well-being (25 effects, 8.6%). Interestingly, the largest proportion of large effects was found in education/learning outcomes (10 effects, 30.3% of all education/learning outcomes), indicating a strong impact of media literacy interventions in this area despite fewer tests.

No effects were reported for civic/participatory outcomes, cognitive outcomes, and technology acceptance outcomes.

Figure 4 presents the effects of media literacy interventions on eight outcome types for "college students," defined as individuals attending higher education institutions, including colleges and universities. Across the 119 studies, 99 effects were tested for college students. The majority of effects were tested for media

Figure 4. Effect size categories by outcome type for college students.

literacy and digital skills (67 effects, 67.7%). Outcomes related to education/learning (15 effects, 15.2%) and psychological well-being (12 effects, 12.1%) were also considered, though to a lesser extent. Effects related to cognitive outcomes (three effects, 3%) and socio-cultural well-being (two effects, 2%) were tested only sporadically. No effects were tested for civic/participatory, physical well-being, or technology acceptance outcomes.

The fourth target group identified in the analysis of 119 studies comprises "(future) teachers." Figure 5 displays the effects of media literacy interventions on this group. Compared to children, youths, and college students, the number of effects tested for teachers is lower and limited to only half of the outcome categories. In total, 36 effects of media literacy interventions on four out of the eight outcome types were measured. The majority
Figure 5. Effect size categories by outcome type for (future) teachers.

were concentrated within education/learning outcomes (19 effects, 52.8%) and media literacy and digital skills outcomes (14 effects, 38.9%). Only one effect was tested for civic/participatory outcomes (2.8%), and two effects for socio-cultural well-being outcomes (5.5%). Interestingly, the effect sizes for teachers tend to be larger: 27.8% of effects were non-significant, 8.3% were small, 8.3% were medium, and 33.3% were large. This contrasts with the proportions of large effects in other groups: 12.1% in college students, 9.6% in youths, and 29.8% in children.

Figure 6 presents the effects of media literacy interventions on "young adults" across eight outcome types. Only seven effects were tested for this group, possibly because many young adults are enrolled in higher education and thus included in the college student category. Additionally, college students are easier to recruit for research studies, leading to their primary inclusion in that target group rather than the broader young adult category. The seven effects were spread across three outcome categories: education/learning (one effect), media literacy and digital skills (four effects), and psychological well-being (two effects). Interestingly, only one of these seven effects was non-significant (14.3%).

Figure 6. Effect size categories by outcome type for young adults.

The next target group for media literacy interventions considered in the 119 studies is "adults." Figure 7 displays the effects of these interventions across eight outcome types. A total of 61 effects were tested for adults, with the majority related to media literacy and digital skills (62.3%) and psychological well-being (31.1%). Only one effect was tested for civic/participatory outcomes (1.6%), and three for socio-cultural well-being outcomes (4.9%). Compared to other target groups, the proportion of larger effect sizes for adults is small, with no large effects and only one medium-sized effect (1.6%). The majority of effects were non-significant (60.7%) or small (26.2%).

Figure 8 presents the effects of media literacy interventions on "older adults" across eight outcome types from the 119 studies analyzed. In total, only 24 effects were tested for this target group. The majority were related to media literacy and digital skills (12 effects, 50%) and psychological well-being (eight effects, 33.3%). Effects on media literacy and digital skills were primarily small (four effects, 33.3%) or medium-sized (four effects, 33.3%),
Figure 7. Effect size categories by outcome type for adults.

Figure 8. Effect size categories by outcome type for older adults.

while most effects on psychological well-being were non-significant (five effects, 62.5%). Only one effect was tested for physical well-being (4.2%) and one for socio-cultural well-being (4.2%). No effects were tested for civic/participatory, cognitive, education/learning, or technology acceptance outcomes in older adults.

The next target group in the 119 studies testing media literacy interventions is "parents" (Figure 9). Parents are significantly underrepresented, with only six effects tested across two outcome types. Specifically, one effect was found for media literacy and digital skills (16.7%), and five effects for education/learning outcomes (83.3%). These effects were either non-significant (three effects, 50%) or small (two effects, 33.3%). One effect lacked an effect size and sufficient information for calculation. No outcomes related to

Figure 9. Effect size categories by outcome category for parents.

civic participation, cognitive abilities, physical well-being, psychological well-being, socio-cultural well-being, or technology acceptance were tested for parents.

The final target group identified in the analysis of the 119 studies is the "general public." Figure 10 illustrates the impact of media literacy interventions on this group. A total of 18 effects were identified, all related to media literacy and digital skills outcomes. Of these, half (nine effects, 50%) were non-significant. Additionally, four effects (22.2%) were small, four effects (22.2%) were medium, and one effect (5.6%) was large.
Figure 10. Effect size categories by outcome category for the public in general.

4. Discussion

4.1. Discussion of Findings

This systematic review aimed to synthesize evidence on effective media literacy intervention programs. By analyzing 119 studies, we identified several critical insights and implications for future research and practice.

A solid theoretical foundation is crucial for effective media literacy interventions. Theories help guide the design, implementation, and evaluation of these interventions in three ways: they shape conceptual frameworks, provide guidance in elaborating/adopting the right research tools and methods (e.g., pre- and post-tests), and enable deeper interpretation of results. While most studies in this review adopted theoretical frameworks, a minority did not, which may limit their ability to explore media literacy-related phenomena. Theories like Bandura's (1977) social learning theory and the message interpretation process model (Austin, Pinkleton, & Funabiki, 2007) are frequently used to understand media literacy outcomes. Theories such as planned behavior (Ajzen & Fishbein, 1975) and technological pedagogical and content knowledge (Mishra & Koehler, 2006) address digital competence.

Among the 119 studies, media literacy outcomes were the most examined. Following closely, outcomes concerning psychological well-being and education/learning were the second and third most extensively examined, respectively. This reflects the increasing importance of these skills in today's digital world. As individuals rely more on digital media and technology, the ability to navigate digital platforms, critically evaluate online content, and use digital tools effectively has become essential (Kirschner & De Bruyckere, 2017). Buckingham (2013) also stresses the need for media education to develop critical thinking and participatory skills in digital environments.

Researchers targeting specific digital skills naturally aim to test whether these skills improve due to the intervention, aligning with Jeong et al.'s (2012) argument about the focus on media-relevant outcomes. However, our findings challenge the assumption that media literacy interventions universally lead to positive outcomes. Despite expectations, a significant proportion of the outcomes showed no significant effect, suggesting that the effectiveness of these interventions may depend on various factors. This contrasts with Jeong et al.'s (2012) meta-analysis, which suggested that media literacy interventions generally produce favorable outcomes. Similarly, while the systematic review by Vahedi et al. (2018) found that interventions significantly improved media literacy skills and had smaller, yet positive effects on attitudes and behavioral intentions, our findings suggest a more nuanced reality. The discrepancies between these studies and ours highlight the importance of understanding the specific conditions under which media literacy interventions succeed. As Potter (2010) emphasizes, contextual factors and methodological rigor are crucial in evaluating the effectiveness of such interventions. In line with this, the meta-analysis by Xie et al. (2019) illustrated that media literacy interventions moderately reduce adolescent deviant behaviors and maintain effects over time, reinforcing the potential of these programs. However, our study underscores that universal positive outcomes should not be assumed without a deeper investigation into the underlying mechanisms that drive success. These findings collectively suggest that while media literacy education holds promise, a more detailed examination of the strategies and contexts that enhance intervention effectiveness is necessary.

The emphasis on psychological well-being and education/learning outcomes highlights the link between media use, mental health, and educational achievements. Rising concerns about digital media's impact on mental health, such as increased stress, anxiety, or depression, have prompted researchers to investigate these areas more thoroughly. Primack et al. (2009) found a significant association between media use and depression in young adults, emphasizing the importance of understanding these psychological impacts. However, based on our results, for the majority of these outcomes, no significant effects were reported. Another systematic review and meta-analysis of interventions with digital tools for mental health promotion among 11–18-year-olds also showed that small, but promising, effects of digital tools were found with respect to promoting well-being, relieving anxiety, and enhancing protective factors (Wright et al., 2023). There is a rising awareness of mental health issues globally, prompting more research into factors that influence psychological well-being. Studies have shown that media consumption and digital interactions significantly impact mental health (Zsila & Reyes, 2023), necessitating interventions that enhance media literacy and digital skills to mitigate negative effects.

Additionally, the integration of digital technologies into education has driven a focus on how these interventions influence educational outcomes and learning processes. Based on our results, only about 38% of the evaluated outcomes were effective and the remaining 62% of outcomes had no effect, small effect or we were not able to calculate the outcome effectiveness. This is sometimes in contrast with previous research such as a study by Tran-Duong (2023) who explored the impact of media literacy on effective learning outcomes in online learning. The author suggested that the four-factor construct of media literacy (functional consumption, critical consumption, critical prosumption, and functional prosumption) significantly influenced perceived learning outcomes among undergraduate students.

Furthermore, the review identified a considerable lack of studies examining outcomes such as civic/participatory engagement, physical well-being, and socio-cultural well-being. This gap highlights the need for broader outcome measures in future research to fully understand the multifaceted impact of media literacy interventions. Future studies should diversify their investigations to capture a wider range of impacts.

The analysis also revealed variations in outcomes across different target groups, ranging from children to older adults, including college students, teachers, and parents. Although previous evidence demonstrates that media literacy interventions were effective across a spectrum of age groups (Jeong et al., 2012), the results of the present study showed that the types of outcomes that are most represented in research differ with varying effectiveness depending on the target group under study, although outcomes relating to media literacy continue to dominate. For instance, for children, youths, and college students, more studies reported on outcomes relating to education and learning than for older age groups. As for their effectiveness, about 48% effects of the interventions emerged as medium and large for children. This figure was less for youth and college students indicating that more studies reported positive outcomes relating to education and learning for children compared to older age groups. These findings suggest that media literacy interventions may be more impactful for younger age groups, particularly children, in terms of educational and learning outcomes. This pattern could be due to several factors, including cognitive development stages (Buckingham, 2013), the design and delivery of interventions (Potter, 2004), and the media consumption habits of different age groups (Palfrey & Gasser, 2008).

While this pattern of larger effect sizes for specific target groups was not consistent across all outcomes and groups, it suggests that careful consideration and specification of target groups in designing and testing interventions can enhance the likelihood of achieving stronger positive effects. Future research should specifically consider the target groups or beneficiaries of media literacy interventions when evaluating their outcomes.

4.2. Study Limitations

This study presents several limitations that must be acknowledged. Firstly, the search was confined to English-language publications, potentially omitting relevant studies conducted in other languages. Future research should endeavor to broaden its scope by conducting searches across multiple languages to ensure a comprehensive review of media literacy intervention literature. Secondly, the review primarily focused on quantitative research, neglecting qualitative methodologies such as interviews or observations. While quantitative studies offer valuable insights, qualitative approaches can provide nuanced perspectives on participants' experiences. Incorporating qualitative methodologies in future studies will enrich our understanding of the impact of media literacy interventions.

Thirdly, despite efforts to be exhaustive, it is possible that some relevant studies were missed in the review process. This could be due to limitations in database coverage or accessibility issues. To mitigate this, future research should employ diverse search strategies and consider alternative sources to capture a broader range of studies. Lastly, the eligibility screening and coding process involved multiple researchers, potentially introducing subjectivity. Despite attempts to ensure consistency, individual judgments may have influenced study selection and interpretation. Enhancing methodological rigor through standardized procedures and transparent reporting is imperative for future research endeavors.

4.3. Future Research

Future research should explore emerging areas in media literacy interventions, including long-term effects, potential mediators and moderators of outcomes, and innovative intervention delivery methods. By addressing these limitations and advancing research in these areas, we can further our understanding of effective strategies for enhancing media literacy and digital skills across diverse populations.

5. Conclusions and Recommendations

Overall, the study highlights the need for a multifaceted approach to media literacy interventions, informed by diverse theoretical frameworks and tailored to diverse target groups. To advance the field, future research should prioritize methodological rigor, incorporate a broader range of outcome measures, and explore mediators and moderators influencing intervention effects. To optimize the efficacy of media literacy interventions, the following recommendations are proposed.

First, intervention providers should draw upon diverse theoretical frameworks from fields such as media studies, media psychology, and pedagogical science to inform the design and implementation of media literacy interventions. By incorporating multiple perspectives, interventions can better address the multifaceted nature of media literacy and digital skills. Theoretical frameworks enhance the depth and rigor of interventions, contributing to more effective learning and skill development across diverse populations.

Second, interventions should be tailored to specific target groups, considering factors such as age, gender, and socio-economic background. By addressing the unique needs and preferences of different demographics, interventions can maximize their effectiveness and relevance. Based on the reviewed studies, we identified several factors that differentiated successful interventions, such as the use of culturally relevant content for minority groups, interactive methods for younger audiences, and a focus on practical digital skills for older adults, providing concrete strategies for researchers and practitioners.

Third, researchers should prioritize methodological rigor in study design and implementation, including the use of randomized controlled trials and consistent reporting of effect sizes. Robust experimental designs are essential for drawing reliable conclusions about intervention effectiveness.

Fourth, future research should incorporate a broader range of outcome measures beyond media and digital literacy, including civic engagement, physical well-being, and socio-cultural well-being, to capture the holistic impact of media literacy interventions. The inclusion criteria for this review were designed to focus on media literacy interventions, but with a wide scope, encompassing positive outcomes across various life domains. This approach reflects the understanding that media literacy interventions often have far-reaching effects beyond just media and digital skills, influencing multiple aspects of individual and societal well-being.

Fifth, researchers should explore mediators and moderators influencing intervention effects, such as gender, socio-economic status, and prior media exposure. Understanding these factors can help identify key mechanisms driving intervention effectiveness and inform targeted intervention strategies.

Finally, collaboration across disciplines, including education, psychology, sociology, and communication, can enrich intervention research on media literacy and promote innovative approaches. Interdisciplinary collaboration can facilitate a holistic understanding of media literacy and digital skills and foster the development of comprehensive intervention strategies.

By implementing these recommendations, intervention providers can develop more effective programs that address the complex challenges of navigating today's digital landscape and promote media literacy and digital skills among diverse populations.

About the Authors

Leen d'Haenens is a full professor and chair of the Media Culture & Policy Lab at KU Leuven. Her research focuses on audience analysis, and media-democracy intersections, young people and (social) media use, with a focus on vulnerable youth with a migration background. She combines quantitative and qualitative methods in multi-site comparisons in migration research. She is editor of *Communications* (De Gruyter) and associate editor of *The International Communication Gazette* (Sage). She is a member of the Euromedia Research Group.

Joyce Vissenberg is a PhD candidate at the Media Culture and Policy Lab at KU Leuven, Belgium. Her research interests include young people's digital literacy, resilience to online risks, news literacy, and studying the effectiveness of interventions aimed at stimulating media literacy and digital skills.

Marit Puusepp is a junior research fellow and PhD student in Educational Science at the Institute of Education at the University of Tartu. Her research focuses on areas such as the assessment of science competence in primary school, peer feedback in teacher education, and parental mediation of digital technologies.

Natalia Edisherashvili (PhD) is a researcher at the Institute of Education, University of Tartu. Her research focuses on interventions supporting technology-enhanced teaching, self-regulated learning, and digital literacy. Natalia adopts a systematic approach and applies her findings to real-world contexts through evidence-based policies, interactive toolkits, and online platforms aligned with modern needs, ultimately bridging the gap between theory and practice to foster effective learning environments.

Diego Martinez-Castro researches digital inequalities and the social use of technology in underserved communities. He holds a PhD in Management, focusing on social inclusion in digital platforms. His work spans topics like ICT4D and the digital divide, with a background in industrial engineering. He has led data analytics projects on Colombia's regional digital divide and managed digital literacy programs in the UK. Diego's community-based experience includes initiatives like Trashware in Colombia and Power to Connect in the UK.

Ellen Johanna Helsper (PhD) is professor of socio-digital inequalities in the Media and Communications Department at the London School of Economics and Political Science. She is director of the PhD program and the MSc in Media and Communications Research. She is co-lead on the Politics of Inequalities Programme and sits on the management board of the Digital Futures for Children (DFC) center. Her research interests include socio–digital inequalities, interpersonal mediated communication, and methodological innovation in media and communications research.

Łukasz Tomczyk is a professor at the Institute of Education (Jagiellonian University, Poland). Ranked among the top 2% of the world's most influential scientists in 2022 and 2023 (Stanford University and Elsevier ranking), his research interests are in media and information education, information society, and lifelong learning. He is a fellow of the Ministry of Science and Higher Education (outstanding young researchers). Currently, he is also a deputy editor in the journal *Education and Information Technologies* (IF = 4.8) and works as a reviewer for several research agencies, including the European Commission.

Tania Azadi (PhD) is a postdoctoral researcher at the Media Culture and Policy Lab, KU Leuven. Her research focuses on promoting information behavior and media and information literacy through exploratory and participatory methods to address information and communication inequality among vulnerable groups. She employs user-centered methodologies, ensuring that the perspectives of these groups are systematically integrated into her research.

Sylwia Opozda-Suder, a PhD in social sciences, is assistant professor at the Laboratory of Social Research Methodology and Data Analysis at the Institute of Education of the Jagiellonian University, Krakow (Poland). Her research interests focus on peer relations among adolescents in the school context and on issues of social research methodology. Methodologically, her work is quantitatively oriented and includes the development and validation of self-reporting scales (factor analysis, reliability and dimensionality analysis, and measurement invariance), structural equation modeling, systematic review, and meta-analysis.

Erika Maksniemi's research focuses on the relationship between socio-digital practices, sleep behaviors, and well-being in the digital age. She examines how these factors are interconnected on both daily and long-term scales. Utilizing advanced multilevel datasets, her work offers deeper insights into this multidisciplinary field, contributing to a better understanding of the complex dynamics between technology use and overall well-being.

Guna Spurava is a researcher with a strong focus on media education. Her research primarily explores how young people engage with digital media, using qualitative methods and participatory approaches. Her current focus is on the influence of artificial intelligence, datafication, and platformisation within digital media environments. She is now working on the concept of "platform awareness" in media education, aiming to empower users by enhancing their understanding of complex algorithm-driven platforms and supporting their agency in the digital world.

Katariina Salmela-Aro (PhD), is an academy professor of Educational Sciences, University of Helsinki, Finland, and a visiting professor Institute of Education University College London and School of Education at Michigan State University. She is the President of the International Association for Applied Psychology (div 5 Educational psychology). She is director of several ongoing longitudinal studies among young people. Her key research themes are academic engagement, burnout, optimal learning moments, experience sampling, transitions, life-span model of motivation, and related interventions.

Niina Sormanen is a postdoctoral researcher at the University of Jyväskylä, Finland. Her research focuses on journalistic media and varied audiences in the digital and social media age and environments and people's related information, digital, and media literacy skills.

Sini Tiihonen (MsocSc) is a project researcher at the Department of Social Sciences and Philosophy, University of Jyväskylä, Finland. Tiihonen is currently working in REMEDIS project (Chanse-program, ERA-net, 2022–2024), and in the Centre of Excellence in Research on Ageing and Care (SRC, 2018–2025). Her research interests include digitalization, the use of new technologies, and initiatives that foster media literacy and digital skills among different target groups.

Terhi-Anna Wilska (PhD) is a professor of sociology, at the Department of Social Sciences and Philosophy, University of Jyväskylä, Finland. Her research focuses on consumption and lifestyles, digitalization and ICTs, age and generation, well-being, and sustainability. In her current research, she particularly focuses on young people in commercial digital environments, such as social media.

Lauri Hietajärvi (PhD) is a senior lecturer and a researcher in Educational Psychology at the Faculty of Educational Sciences, University of Helsinki. His work, among other themes, focuses on the well-being and competencies of adolescents in the digitalized world.

Gemma Martínez (PhD in Social Communication) is a researcher at the University of the Basque Country (UPV/EHU). She has been a member of the EU Kids Online research network since 2007. Her research interests encompass the study of parental and teacher mediation processes regarding children's internet use and its impact on their well-being. She is currently involved in various national and European research projects, including REMEDIS (CHANSE) and SIC-Spain 4.0 (Safer Internet Center-Spain).

Nekane Larrañaga (PhD) is a senior lecturer in Sociology at the Faculty of Education, Philosophy, and Anthropology at the University of the Basque Country (UPV/EHU). She has been a member of the EU Kids Online research network since 2017 and is involved in various competitive European, national, and regional research projects, such as REMEDIS and SIC-Spain (Safer Internet Centre). Her research interests include diversity, intercultural relations, identity, digital citizenship, and the experiences of children and adolescents on the internet.

Maialen Garmendia (PhD) is senior lecturer in Sociology at the Faculty of Education, Philosophy, and Anthropology, University of the Basque Country (UPV/EHU). Her interests are in social research techniques, audience research and digital technologies, and everyday life. Since 2006 she has been a member of the EU Kids Online network. She coordinated the Net Children Go Mobile project in Spain. She has also taken part in Children Online: Research Evidence (CO:RE). Her team is also involved in several fieldworks conducted with families and parents within the Safer Internet Centre Spain coordinated by the Spanish Institute for Cybersecurity (INCIBE).

Rubén Olveira-Araujo (PhD) is assistant professor in Audiovisual Communication and Advertising Department at the University of the Basque Country (UPV/EHU). His main research interests include the impact of ICT on well-being, gender and sexual diversity, and the use of big data in media analysis and journalism.

Verónica Donoso (PhD in Social Sciences, KU Leuven, Belgium) is a research fellow at the Media Culture & Policy Lab at KU Leuven and a consultant specialized in digital literacy, online safety, and education. She is also the Digital Literacy and Child Online Safety adviser at European Schoolnet, a network of 34 ministries of education supporting the transformation of education processes for 21st century digitalized societies.

![cogitatio logo]

Margus Pedaste is a full professor of educational innovation at the Institute of Education of the Faculty of Social Sciences of the University of Tartu. He is also the head of the Institute of Education. He has led or participated as a principal investigator in several international research and development projects to support students' learning, teachers' professional development, and teacher education reform in Estonia.

Dominika Sepielak (MA) is a PhD candidate in the field of education at the Jagiellonian University in Krakow. She is currently working on her thesis concerning academic didactic. She is also a psychology student, which allows her to deepen her knowledge in developmental psychology and the process of learning.
